I am interested in materials science and semiconductor devices. I would like to get hands on experience of semiconductor fabrication along with theoretical concepts from my coursework, making HackerFab's open-source, low-cost manufacturing vision a perfect fit for my interests. In the short term, I want to master existing toolsets like litho-v1 and sputter-v2, learn core semiconductor processes, and actively contribute to tool and process development. My long-term goal is to apply these skills to help fabricate functional devices like MOSCAPs and NMOS transistors from scratch. Through HackerFab, I hope to gain practical hardware intuition and a deep, real-world understanding of semiconductor processing that will be useful in the future in my career.
